A SIMPLE GUIDE TO HEMANGIOMAS, (Strawberry Birthmark) Diagnosis, Treatment And Related Conditions by

Dr. Kenneth Kee
M.B.,B.S. Ph. D

Chapter 1 Hemangioma I had a patient who had four children, 2 girls and 2 boys. The children were seeing me from small. One of the younger girl had a strawberry birthmark on her right back shoulder. I told the mother that it will normally disappear at the age of 7 years. She was surprised as she wanted to send the child for surgery when she was bigger. True enough by the age of 6 years old the strawberry birthmark began to shrink and by 7 years it had disappeared totally. The mother was pleasantly surprised. What is a hemangioma? A hemangioma is a medical disorder that causes abnormal buildup of blood vessels in the skin or internal organs.

A hemangioma is a group of blood vessels that develop like a lump under the skin It has been called a strawberry mark as it appears like the surface of a strawberry. 1. Superficial hemangiomas are normally raised, red areas of skin, which are warm because the blood vessels are near the surface. They can look at first like a small area of pale skin where a red spot forms. Superficial hemangiomas are quite different to other forms of birthmark and easily identifiable, so no special diagnostic tests are normally required. 2. Deep hemangiomas are blue in color because the blood vessels of the hemangioma are deeper in the skin. The patient or parent normally does not observe them for the first few weeks as they only show a lump as the hemangioma grows. A deep hemangioma, near the eye or on internal organs, often requires ultrasound and MRI scans to validate diagnosis, location, and to assess the depth of the involved blood vessels. About 10% babies have a hemangioma. They are found more often in girls, premature babies, low birth weight babies and multiple births babies, such as twins. Most hemangiomas occur during the first few weeks and proliferate rapidly for 612 months (the growth phase). Then they start a process of involution (the shrinking

phase) which can last one to seven years. Most hemangiomas only grow to the size of 1 or 2 penny coin but a few can grow much larger. Hemangiomas can appear anywhere on the body. About 60% of hemangiomas occur in the head and neck area. 25% occur in the trunk. 15% occur in the arms or legs. They can also occur on internal organs. This is more frequent when a child has multiple hemangiomas. The ultrasound scan can show this if a child has 3 or more. The liver is most often involved, but the airway, heart and brain are sometime involved too. What are the causes of Hemangioma? Causes About 33% of hemangiomas are present at birth. The rest occur in the first several months of life. The exact cause is not completely known. Hemangiomas are mostly genetic in nature. They may be inherited as in families as an autosomal dominant trait. The hemangioma may be present: 1. In the top skin layers (capillary hemangioma) 2. Deeper in the skin (cavernous hemangioma) 3. A mixture of both What are the symptoms of Hemangiomas? Symptoms Symptoms of a hemangioma are: 1. A red to reddish-purple, raised lesion (patch) on the skin 2. A massive, raised, benign tumor with blood vessels Most hemangiomas can be found on the face and neck. Hemangiomas are observed as red to purple papules or plaques with a normal epithelial surface. Compression results in partial emptying and the color become less obvious. They may happen at any age, and stay fixed in site and size. There are various forms: 1. Capillary nevus - this is a salmon-pink patch observed on the neck in up to 40% of infants. It may not disappear, but is frequently covered by hair. Facial patches are likely to fade in the first year of life. 2. Port-wine stain - this is a patch lined with endothelial cells and containing blood vessels. It does not shrink with age.
